

VaultKeepR iOS — End-to-End Test Report

Tool: **Maestro** (mobile UI testing framework) · Platform: iOS simulator · Application: VaultKeepR (com.vaultkeeper.app)

RESULT: PASSED — 14/14 FLOWS

TOOL-GENERATED OUTPUT

14 / 14

FLows PASSED

371

ASSERTIONS (325 EXECUTED & PASSED)

0

FAILURES

7m 50.6s

TOTAL RUN TIME

Coverage — user journeys exercised end-to-end on the shipped iOS build:

- Vault lifecycle** — creation with master password, unlock, manual lock, automatic session lock (background/foreground cycle), failed-unlock rejection.
- Credential management** — create login entry, create secure note, edit entry (website field), delete entry, list scroll & visibility, quick search.
- Security tools** — password generator (regeneration), password health audit, breach scanner, 2FA/TOTP tab gating.
- Settings & premium** — navigation across General / Security / Privacy panes, session-duration control, Premium paywall display.
- Backup flow** — encrypted backup export with explicit "I saved this file somewhere safe" acknowledgement.

Per-flow results

#	FLOW	SCENARIO	ASSERTIONS	DURATION	STATUS
01	create-vault	Create vault + master password + backup export	27	41.7s	PASS
02	unlock-vault	Unlock with master password	18	21.3s	PASS
03	add-entry-login	Add login entry (username + password)	30	38.7s	PASS
04	add-entry-note	Add secure note (title + content)	27	35.2s	PASS
05	edit-delete-entry	Edit entry website field, then delete entry	50	1m 17.3s	PASS
06	quick-search	Quick search across vault entries	25	27.4s	PASS
07	generator	Password generator + strength display	26	27.3s	PASS
08	password-health	Password health / security audit screen	22	24.8s	PASS
09	breach-scanner	Breach scanner screen	22	25.1s	PASS
10	totp-tab	2FA/TOTP tab (premium gating)	20	22.0s	PASS
11	settings-nav	Settings navigation + Premium paywall	34	36.5s	PASS
12	lock-cycle	Manual lock → unlock cycle	33	43.3s	PASS
13	wrong-password	Wrong master password rejected ("Invalid commitment")	9	12.8s	PASS
14	session-lock	Session lock after backgrounding (deep-link resume)	28	37.3s	PASS

371 total assertions across 14 flows: 325 executed and passed; 46 are conditional guards (*run-flow-when* steps for OS dialogs and locale-dependent modals) that did not trigger on this run and were skipped by design. All durations are wall-clock times measured by Maestro.

Security-relevant behaviours verified

BEHAVIOUR	VERIFIED BY
Wrong master password is rejected (invalid commitment error surfaced, vault stays locked)	Flow 13
Manual lock returns the app to the locked state; unlock re-prompts for the master password	Flow 12
Session locks automatically after backgrounding the app (deep-link resume shows the unlock screen)	Flow 14
Backup export requires an explicit user acknowledgement that the file was stored safely	Flow 01
Password generator produces entries with displayed strength rating; regeneration works	Flow 07

Method & scope

Tests were executed with **Maestro**, an open-source mobile UI testing framework, against the production iOS application binary on an iOS simulator, on 27 September 2026. Each flow starts from a controlled app state and drives the real user interface: taps, text input, keyboard events, scrolling, backgrounding and deep links — the same interactions a human user would perform. This report is functional end-to-end evidence (UI behaviour), complementary to the static-analysis scans published in this repository; it is not a manual code audit.

The Maestro flows themselves are maintained in the private application repository. This document is a regenerated summary of the raw Maestro HTML report produced by `maestro test`; no test result was altered. E2E credential values used by the test suite are redacted from this document.

Reproducibility: raw output of `maestro test` against `com.vaultkeeper.app`, run started 2026-09-27 18:07:01 CEST, total duration 7m 50.598s. Report regenerated for publication; format follows the repository `audits/` convention. Questions: security@vaultkeepr.xyz.
